

Q1) What is the difference between a Web Page and a Website? Explain with suitable examples.

A web page is a single document of a website. It is a single page shown on a website. On the other hand, a website is a collection of web pages. It contains multiple documents or web pages connected to one another through hyperlinks.

Feature	Web Page	Website
Scope	A single document or page.	A collection of multiple interconnected web pages.
Address	Identified by a specific, full URL path (e.g. https://amazon.com/about).	Identified by a root domain name (e.g. https://amazon.com).
Development	Requires less time and focuses on localized content.	Requires more time and focuses on the entire system it is trying to represent.
Analogy	A single page in a book.	The entire book itself.

Q2) What is HTML? Why is it used in web development?

HTML or HyperText Markup Language is a structured language used to give the structure of web pages.

It is used in web development:

- To describe the structure of web elements.
- It tells the browser how to display the content.
- To display content on web browsers like images, videos etc.
- To create hyperlinks
- To work with CSS files to apply styling
- To work with Javascript adding functionality
- It is supported in all major web browsers making it the foundation of every website.

Q3) What is the basic structure of an HTML document? Explain the purpose of the following tags:

`<!DOCTYPE html>`
`<html>`

<head>
<title>
<body>

```
<!DOCTYPE html> <!--It declares that it is HTML5 document so that it can
render correctly -->
<html>
<!--It is the root element and it contains all the html code in it -->
<head>
<!--It contains information about the webpage such as titles, meta-tags, CSS
links etc. It is used for content that should not be displayed on a web page.-->
  <title>My Web Page</title>
<!--It is used to set the title of the web page and appears on browser tab-->
</head>
<body>
<!--Contains all the visible content of the webpage, such as headings,
paragraphs, images, links, tables, and forms -->
</body>
</html>
```

**Q4) What is the difference between Heading tags and the Paragraph tag?
Write the syntax of any three heading tags.**

Heading Tags	Paragraph Tag
It is used to define headings and subheadings.	It is used to define a paragraph of text.
It is displayed in larger and bold text by default.	It is displayed in normal-sized text.
It helps organize the content of a webpage.	It is used to present detailed information or content.
There are six heading levels (<h1> to <h6>).	There is only one paragraph tag (<p>).

Syntax

```
<h1>This is Heading 1. It is the main heading. It is always used once.</h1>
<h2>This is Heading 2. It is the sub heading.</h2>
<h3>This is Heading 3. It is the sub-division heading.</h3>
```

Q5) Why is HTML called a Markup Language?

HTML is called a Markup Language because it uses markup tags to *mark up* or define the structure and content of a web page on a browser. These tags tell the web browser how different elements, such as headings, paragraphs, images, links, and tables, should be displayed.
